Homework 2

Computer Vision 2024 Spring

Image stitching

- 1.Detecting key point(feature) on the images
 - SIFT
- 2. Finding features correspondences (feature matching)
 - KNN
- 3. Computing homography matrix.
 - RANSAC
- 4. Stitching image (warp images into same coordinate system)
 - Homography

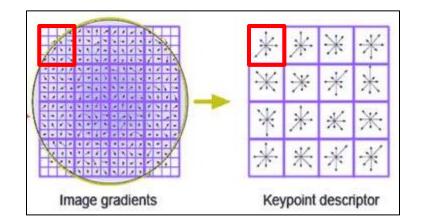

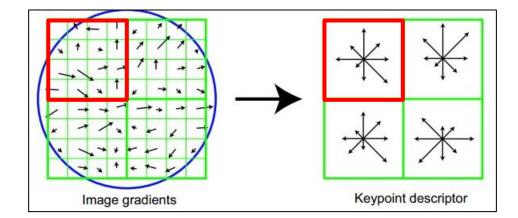

Feature Detection

- Finding features correspondences/compute homography matrix.
- SIFT Scale Invariant Feature Detection
 - detect key points in the image and describe the points as 128-dimensional features (4 * 4 * 8).
- Check Ch.6 > 7 for more details of SIFT.

1. SIFT in OpenCV

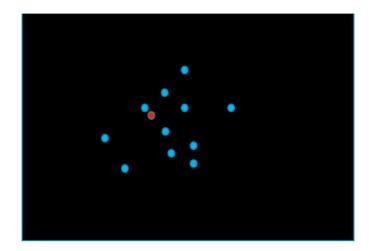

- Using OpenCV to detect SIFT key points of two images
- Input : gray scale image

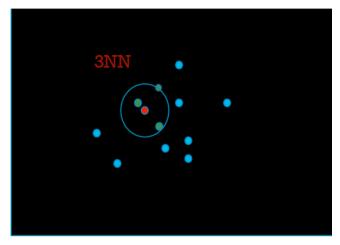

```
SIFT_Detector = cv2.SIFT_create()
kp, des = SIFT_Detector.detectAndCompute(img, None)
```

- output : keypoints (array), Descriptors (array)
- Keypoints store feature points
 - for a single keypoint you can use ".pt" to get the position of this key point on image [Ref]
- Descriptors store the 128-dimensional features
- The function name(detectAndCompute) of SIFT may be different with the version of OpenCV

2. Feature matching - KNN

- K-Nearest Neighbor
 - Finding the K closest neighbors to the target.
 - Brute-force: Comparing with the all 2-norm of SIFT feature (the 2-norm of descriptor)

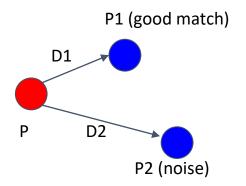

2. Feature matching - Lowe's Ratio test

- Lowe's Ratio test for eliminating bad match
 - A good match shold be able to be distinguished from noise
 - 1. For every key point P in image1 using 2NN to get 2 matched key points P1 & P2 in image2
 - 2. Computing the 2-norm of P1 & P2 between P named D1, D2
 - 3. If D1 < threshold * D2 then P1 is a good match

(threshold is a programmer defined ration between 0 to 1, the suggestion of OpenCV tutorial is $0.7^{\circ}0.8$)

Construct a linear system as: P2=HP1, P2 = (x2,y2,1), P1 = (x1,y1,1)
 where P2 and P1 are correspondence points, H is homography matrix.

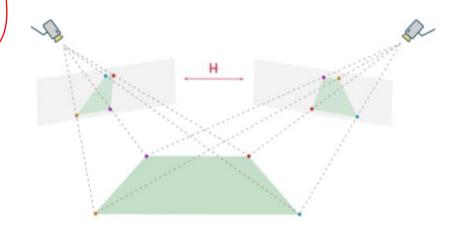

$$\begin{bmatrix} H_{11} & H_{12} & H_{13} \\ H_{21} & H_{22} & H_{23} \\ H_{31} & H_{32} & H_{33} \end{bmatrix} \begin{bmatrix} x_1 \\ y_1 \\ z_1 \end{bmatrix} \Leftrightarrow \mathbf{x}_2 = H\mathbf{x}_1$$

$$x_2' = \frac{H_{11}x_1 + H_{12}y_1 + H_{13}z_1}{H_{31}x_1 + H_{32}y_1 + H_{33}z_1}$$
$$y_2' = \frac{H_{21}x_1 + H_{22}y_1 + H_{23}z_1}{H_{31}x_1 + H_{32}y_1 + H_{33}z_1}$$

$$x_2'(H_{31}x_1 + H_{32}y_1 + H_{33}) = H_{11}x_1 + H_{12}y_1 + H_{13}$$

$$y_2'(H_{31}x_1 + H_{32}y_1 + H_{33}) = H_{21}x_1 + H_{22}y_1 + H_{23}$$

In homogenous coordinates ($x_2' = x_2/z_2$ and $y_2' = y_2/z_2$)

• If we restrict h33 = 1

$$x_2'(H_{31}x_1 + H_{32}y_1 + 1) = H_{11}x_1 + H_{12}y_1 + H_{13}z1 \ y_2'(H_{31}x_1 + H_{32}y_1 + 1) = H_{21}x_1 + H_{22}y_1 + H_{23}z1 \ x_2' = H_{11}x_1 + H_{12}y_1 + H_{13}z1 - H_{31}x_1x_2' - H_{32}y_1x_2' \ y_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{23}z1 - H_{31}x_1y_2' - H_{32}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{22}y_1 + H_{23}z1 - H_{23}y_1y_2' \ x_2' = H_{21}x_1 + H_{22}y_1 + H_{22}y_1 + H_{23}y_1 +$$

 For perspective transformation, you can use 4 pairs of match result to solve 8 unknown variable in homography matrix

$$\begin{bmatrix} \hat{x}_i z_a \\ \hat{y}_i z_a \\ z_a \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} & h_{13} \\ h_{21} & h_{22} & h_{23} \\ h_{31} & h_{32} & h_{33} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ y_i \\ 1 \end{bmatrix} \begin{bmatrix} x_1 & y_1 & 1 & 0 & 0 & 0 & -x_1 \hat{x}_1 & -y_1 \hat{x}_1 \\ x_2 & y_2 & 1 & 0 & 0 & 0 & -x_2 \hat{x}_2 & -y_2 \hat{x}_2 \\ x_3 & y_3 & 1 & 0 & 0 & 0 & -x_3 \hat{x}_3 & -y_3 \hat{x}_3 \\ x_4 & y_4 & 1 & 0 & 0 & 0 & -x_4 \hat{x}_4 & -y_4 \hat{x}_4 \\ 0 & 0 & 0 & x_1 & y_1 & 1 & -x_1 \hat{y}_1 & -y_1 \hat{y}_1 \\ 0 & 0 & 0 & x_2 & y_2 & 1 & -x_2 \hat{y}_2 & -y_2 \hat{y}_2 \\ 0 & 0 & 0 & x_3 & y_3 & 1 & -x_3 \hat{y}_3 & -y_3 \hat{y}_3 \\ 0 & 0 & 0 & x_4 & y_4 & 1 & -x_4 \hat{y}_4 & -y_4 \hat{y}_4 \end{bmatrix} \begin{bmatrix} h_{11} \\ h_{12} \\ h_{13} \\ h_{21} \\ h_{22} \\ h_{23} \\ h_{31} \\ h_{32} \end{bmatrix} = h_{33} \begin{bmatrix} \hat{x}_1 \\ \hat{x}_2 \\ \hat{x}_3 \\ \hat{x}_4 \\ \hat{y}_1 \\ \hat{y}_2 \\ \hat{y}_3 \\ \hat{y}_4 \end{bmatrix} \begin{bmatrix} \hat{x}_1 \\ \hat{x}_2 \\ \hat{x}_3 \\ \hat{x}_4 \\ \hat{y}_1 \\ \hat{y}_2 \\ \hat{y}_3 \\ \hat{y}_4 \end{bmatrix} \begin{bmatrix} \hat{x}_1 \\ \hat{x}_2 \\ \hat{x}_3 \\ \hat{x}_4 \\ \hat{y}_1 \\ \hat{y}_2 \\ \hat{y}_3 \\ \hat{y}_4 \end{bmatrix}$$

- Let h33 = 1
- You can solve the equation Ah = b below by pseudo inverse

$$\begin{bmatrix} \hat{x}_i z_a \\ \hat{y}_i z_a \\ z_a \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} & h_{13} \\ h_{21} & h_{22} & h_{23} \\ h_{31} & h_{32} & h_{33} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ y_i \\ 1 \end{bmatrix} \begin{bmatrix} x_1 & y_1 & 1 & 0 & 0 & 0 & -x_1 \hat{x}_1 & -y_1 \hat{x}_1 \\ x_2 & y_2 & 1 & 0 & 0 & 0 & -x_2 \hat{x}_2 & -y_2 \hat{x}_2 \\ x_3 & y_3 & 1 & 0 & 0 & 0 & -x_3 \hat{x}_3 & -y_3 \hat{x}_3 \\ x_4 & y_4 & 1 & 0 & 0 & 0 & -x_4 \hat{x}_4 & -y_4 \hat{x}_4 \\ 0 & 0 & 0 & x_1 & y_1 & 1 & -x_1 \hat{y}_1 & -y_1 \hat{y}_1 \\ 0 & 0 & 0 & x_2 & y_2 & 1 & -x_2 \hat{y}_2 & -y_2 \hat{y}_2 \\ 0 & 0 & 0 & x_3 & y_3 & 1 & -x_3 \hat{y}_3 & -y_3 \hat{y}_3 \\ 0 & 0 & 0 & x_4 & y_4 & 1 & -x_4 \hat{y}_4 & -y_4 \hat{y}_4 \end{bmatrix} \begin{bmatrix} h_{11} \\ h_{12} \\ h_{13} \\ h_{21} \\ h_{22} \\ h_{23} \\ h_{31} \\ h_{32} \end{bmatrix} = h_{33} \begin{bmatrix} \hat{x}_1 \\ \hat{x}_2 \\ \hat{x}_3 \\ \hat{y}_4 \end{bmatrix}$$

$$A = U\Sigma V^T$$

- Using SVD decomposition to find Least Squares error solution of Ah = 0
- the solution = eigenvector of $A^T\!A$ associated with the smallest eigenvalue (V stores the eigenvector of $A^T\!A$, Σ stores the singular value (root of eigen value))

find the smallest number in Σ and H = corresponding vector in V^T

Remember to normalize h33 to 1

$$\mathbf{h} = (H_{11}, H_{12}, H_{13}, H_{21}, H_{22}, H_{23}, H_{31}, H_{32}, H_{33})^{T}$$

$$\mathbf{a}_{x} = (-x_{1}, -y_{1}, -1, 0, 0, 0, x'_{2}x_{1}, x'_{2}y_{1}, x'_{2})^{T}$$

$$\mathbf{a}_{y} = (0, 0, 0, -x_{1}, -y_{1}, -1, y'_{2}x_{1}, y'_{2}y_{1}, y'_{2})^{T}.$$

You can multiply a minus to match the form in previous slide

A is a 9 by 9 matrix

(It's similar to A in previous slide)

SVD: https://web.mit.edu/be.400/www/SVD/Singular Value Decomposition.htm

Homography: https://cseweb.ucsd.edu/classes/wi07/cse252a/homography estimation/homography estimation.pdf

3.RANSAC

Random Sample Consensus

Input : *M* match;

- 1. Randomly select 4 data points as inliers S. Find a homography matrix H to S.
- 2. Test all match(p1, p2) against H, estimate p2' = p1 * H
 if the distance between p2' and p2 is small, add the match to S, which is called a consensus set.
- 3. If |S| is larger than ever, mark H as the best estimated H*.
- 4. If some stopping criterion is satisfied, end
- 5. Else go to step 1.

Note that you can re-estimate the models with the consensus sets.

4. Stitching image

- 1. Using homography matrix H to calculate the position of 4 corners of image1 in the perspective of image2
- 2. Using image1 after perspective transformation to analyze the size which we need to combine two image together of
- 3. Using cv2.warpPerspective(src, M, dsize, ...) to warp the whole image1
 - src is source image1, M is homography matrix H, dsize is output image size warped_1 = cv2.warpPerspective(src=img1, M=H, dsize=size)
- 4. Concating two images (for better results you can use blending or some ways to improve the quality of overlap part)

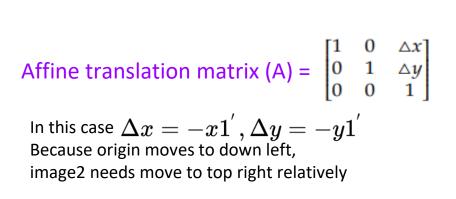

For stitching images you can use any function of OpenCV

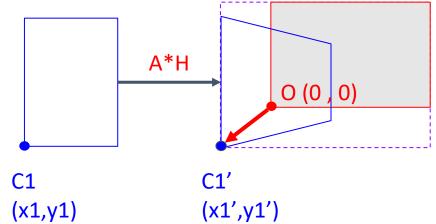

```
corners' = corners * H
x1' = min(min(corners'_x),0)
y1' = min(min(corners'_y),0)
```

- Assume image1 is on left hand side and image2 is on right hand side
- Size we need = (w2 + abs(x1'), h2 + abs(y1'))

width of image2 = w2height of H (homography) image2 = h2O(0,0)C1 (x1,y1) C1' (x1',y1')

- For both images using affine translation to move the origin O to C1'.
 This way gives some space to image1 and it's easier to combine them in same image size.
- For image1 your homography matrix(H)s need multiply translation matrix (A) because we translate the perspective of image2
- For image2 you can directly warp with affine translation matrix(A)

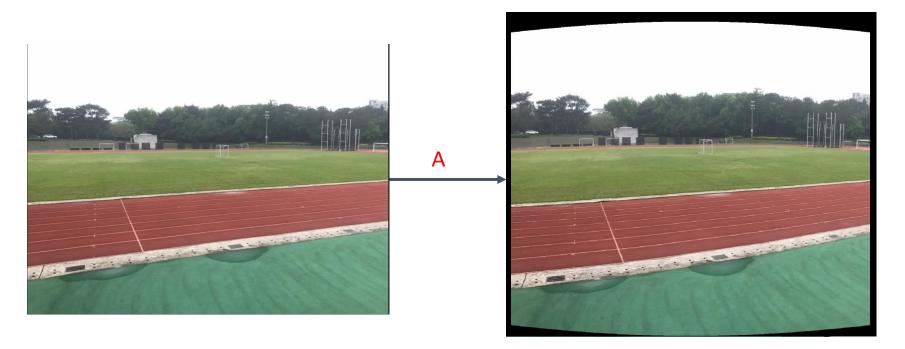

Example for image1 applys perspective transformation

warped_l = cv2.warpPerspective(src=img1, M=H, dsize=size) A*H

Example for using affine translation to move the image2 origin O to C1'

warped_r = cv2.warpPerspective(src=img2, M=A, dsize=size)

Requirements

- You are only allowed to use the function of OpenCV mentioned in previous slides. Please implement all (key point matching ,RANSAC , Homography , cylindrical projections,...) by youself
 - For submission you can use :
 - SIFT
 - For debugging only:
 - KNN match : BFMatcher()
 - Homography : findHomography()
- But there is no limitation of "image stitching" only (You can use any function provided by OpenCV)

Grading

50% Image stitching

- SIFT (10%)
- KNN (10%)
- RANSAC (15%)
- Homography (15%)

30% Report (Don't just paste the code with comment)

- 1. Explain your implementation
- 2. Show the result of stitching "Base" images (and "Challenge image" if you did that part).
- 3. Discuss different blending method result.

(The below two part of grade you got may "vary" according to the stitched image "quality", methods you used, and so forth.)

- 10% **Stitching 3 images** seamlessly with blending and show result in report
- 10% <u>Challenging task</u>: stitching 6 modified photos with gain compensation method applied, and then showing the result in the report and explaining what you did.

Deadline

- Deadline: 2024/05/12 (Sun.) 11:59 pm
- Please zip the all files and name it as {studentID}_HW2.zip :
 ex 312550000_HW2.zip (wrong file format may get -10% panelty)
 - Zip file format:
 - 1. {studentID}_report.pdf
 - 2. your code
- Penalty of 3% of the value of the assignment per late day
 - late a day: your_score * 0.97
 - late two days: your_score * 0.94
- Feel free to send e-mails through E3 platform to all TAs for personal questions.

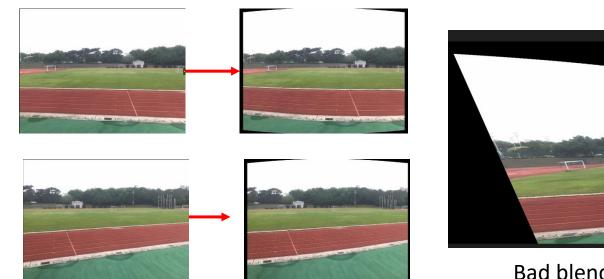

Example Result

Sample of concatenating all 3 Base images

Others Tips

- Using different blending method to improve the quality
- Preprocessing for more easily concatenate multiple image :
 Cylindrical projection

Cylindrical projection on images

Bad blending method example

Challenging Task-Gain compensation

$$e = \frac{1}{2} \sum_{i=1}^{n} \sum_{j=1}^{n} N_{ij} \left((g_i \bar{I}_{ij} - g_j \bar{I}_{ji})^2 / \sigma_N^2 + (1 - g_i)^2 / \sigma_g^2 \right)$$

Challenging Task-Gain compensation

 Stitching them seamlessly and show how you find your optimizing "g" in the report
